

VINI VICI VIDI

PREMIUM SILVER COLLECTION

Product Requirements Document (PRD)

Document purpose

Single source-of-truth product specification for the premium silver collection e-commerce website, covering customer experience, commerce, admin operations, integrations, quality requirements, and delivery acceptance.

Field	Value
Document version	1.0 - Consolidated PRD
Date	19 September 2026
Business	Vini vici vidi
Product	Premium Silver Collection E-commerce Website
Primary payment gateway	Razorpay
Customer accounts	Not required - guest checkout
Primary support channel	WhatsApp

Prepared from the two supplied client requirement forms plus the latest client updates.

1. Executive Summary

Vini vici vidi requires a premium e-commerce website for its Premium Silver Collection. The supplied client forms describe a jewellery business serving India, with a premium, modern, sleek and elegant visual direction, green and white brand colors, more than 100 products, product categorization, direct online purchase, WhatsApp contact, payment processing and order tracking. The latest client updates supersede earlier conflicting answers on customer accounts and payment methods: customer login is not required and Razorpay is the payment gateway.

The product is therefore defined as a guest-first commerce experience: a visitor should be able to discover products, understand price and availability, add products to cart, complete checkout without an account, pay through Razorpay, and receive an operational order record that the business can manage from an admin dashboard.

The front end must feel distinctly premium. The experience should include a fabulous opening/entry sequence, polished animation, strong product presentation, offer messaging such as a 50% offer, inventory-aware attention messaging such as “3 stocks left”, and a clean luxury visual system. The back office must support product, price, discount, inventory and order management so the business can keep the storefront current without developer intervention.

Authoritative update

Where the earlier questionnaires conflict with the latest instruction, this PRD follows the latest instruction: no login/registration and Razorpay payments.

2. Source of Truth and Change Log

The source material consists of two client requirement forms submitted in August 2026 and a later set of explicit client updates. The older forms contain a small number of conflicts. This PRD documents the conflicts rather than silently hiding them.

Area	Earlier source answer(s)	Current PRD decision	Status
Customer accounts	One form: No; another form: Yes	No customer login or registration. Use guest checkout.	Superseded
Payment methods	Mixed options including PayPal, cards, bank transfer, COD, UPI, etc.	Razorpay is the required payment gateway. Exact enabled payment instruments are configurable within Razorpay and business policy.	Superseded
Order workflow	Shopping cart and order tracking requested	Shopify-like order lifecycle and admin workflow are required; do not copy Shopify UI.	Confirmed + expanded
Brand positioning	Jewellery; modern/sleek; elegant/luxury; premium	Premium Silver Collection with luxury presentation.	Confirmed + expanded

Area	Earlier source answer(s)	Current PRD decision	Status
Promotional messaging	Special offers requested in form	Show 50% OFFER messaging as a supported promotional state.	New explicit update
Stock urgency	Availability selected	Support inventory-aware “3 stocks left” messaging.	New explicit update
Entry experience	Premium animations	Fabulous opening / entry experience is required.	Expanded
Pricing	Price displayed	Real-time price updating required.	Expanded
Messaging	WhatsApp selected	WhatsApp is a first-class contact channel.	Confirmed

3. Product Vision and Positioning

Product vision: create a premium digital storefront where the visual quality of a luxury silver collection is matched by frictionless commerce and professional back-office operations.

3.1 Core product principles

- Premium first: the first impression, product detail and checkout journey should feel curated rather than template-driven.
- Guest-first commerce: buying must not depend on account creation.
- Trust through clarity: show product information, current price, availability, delivery/order status and payment state clearly.
- Operational control: the business should be able to manage catalog, pricing, offers, stock and orders from the admin side.
- Mobile-ready: the storefront should work as a serious shopping experience on phones as well as desktop.
- WhatsApp-connected: customers should have an immediate route to assistance or enquiry.

3.2 Visual direction

Element	Source-confirmed direction	PRD interpretation
Brand colors	Green and white	Primary UI palette should stay within the confirmed green/white identity.
Style	Modern, sleek, elegant, luxury, premium	Use restrained layouts, strong typography, high-quality product photography and motion.
Collection	Premium Silver Collection	Silver product imagery and material cues should be featured prominently; any additional UI accent colors require brand approval.

Element	Source-confirmed direction	PRD interpretation
Animation	Premium Animations	Use purposeful entrance, reveal and interaction motion; avoid motion that delays shopping or harms accessibility.

4. Goals and Success Measures

Goal	Measure / acceptance signal	Priority
Enable online sales without customer accounts	A first-time customer can purchase without login/registration.	P0
Reliable digital payment	Successful, failed, cancelled and pending Razorpay payments are correctly reflected in order state.	P0
Operational order management	Every valid order is visible in admin with status and essential customer/order information.	P0
Current product information	Admin price/stock changes are reflected on the storefront without requiring a code deployment.	P0
Premium customer experience	Opening experience, product pages, cart and checkout meet agreed visual direction.	P1
Customer communication	WhatsApp route is accessible from relevant pages and contact touchpoints.	P1
Merchandising	Offers and low-stock messaging can be configured and displayed appropriately.	P1

5. Users and Personas

Persona	Needs	Key journeys
Guest shopper	Discover products, compare options, view price/availability, buy quickly.	Home -> collection -> product -> cart -> checkout -> payment -> confirmation
Returning shopper	Recognize brand, quickly find products, buy again without remembering a password.	Direct product/collection -> cart -> guest checkout
Enquiry shopper	Ask a product question or request assistance before buying.	Product -> WhatsApp / Contact -> assisted purchase or later checkout
Store/admin operator	Maintain catalog, price, inventory, offers and orders.	Admin -> product/order management -> updates -> storefront/order follow-up

The supplied source material does not define separate staff roles, approval hierarchies or advanced customer segmentation. Those should remain configurable/TBD rather than assumed.

6. Scope

6.1 In scope

- Premium home page and opening experience.
- Product catalog with categories and more than 100 products.
- Product detail pages with images, description, features/specifications, price, discount, availability, reviews and buy/enquiry actions as applicable.
- Search, gallery and social links.
- Shopping cart and guest checkout.
- Razorpay payment integration.
- Order creation, payment state, order status and admin order management.
- Inventory-aware stock display and low-stock messaging.
- Configurable promotional messaging including 50% offer presentation.
- Real-time/current price updates from admin-controlled product data.
- WhatsApp integration and contact paths.
- Admin catalog, price, inventory, offer and order management.
- Responsive experience, performance, security and QA.

6.2 Not in scope unless later approved

- Mandatory customer accounts, customer password recovery or loyalty accounts.
- Subscription commerce or marketplace functionality.
- Complex B2B wholesale pricing workflows.
- Native mobile apps.
- International tax/shipping rules not supplied by the client.
- Advanced ERP/CRM integrations not specified in the source requirements.

7. Information Architecture

The source forms identify Home, About Us, Products, Services, Gallery, Portfolio, FAQ, Contact Us, Careers, Privacy Policy and Terms & Conditions, with additional optional content areas. For the commerce-focused product, the recommended navigation groups these into shopper tasks while retaining the requested pages.

Primary area	Child / related pages	Purpose
Home	Hero / entry, featured products, offers, testimonials, gallery, social links, contact	Brand introduction and conversion
Shop / Products	Categories, search results, filters	Browse the collection
Product	Product information, price, availability, reviews, buy/enquiry	Decision and purchase
About	About Us, brand story	Trust and brand context
Gallery	Image/video gallery	Visual storytelling

Primary area	Child / related pages	Purpose
Support	FAQ, Contact Us, WhatsApp	Assistance and enquiries
Legal	Privacy Policy, Terms & Conditions	Required legal content supplied by business
Checkout	Cart, customer details, delivery details, payment, confirmation	Guest purchase flow
Admin	Dashboard, Products, Inventory, Orders, Offers, Content	Operational management

8. Customer Experience and User Journeys

8.1 First-visit journey

Proposed flow: Entry animation -> premium hero -> featured / offer messaging -> category or product discovery -> product detail -> cart -> guest checkout -> Razorpay -> order confirmation.

8.2 Product discovery journey

- Visitor sees categories and featured products.
- Visitor can use search and browsing controls.
- Product cards show core information and current pricing.
- Low stock / offer badges are displayed when valid configuration or inventory state supports them.
- Visitor opens product detail for full information and purchase/enquiry actions.

8.3 Purchase journey

1. Add product to cart.
2. Review quantities, prices, discount and estimated total.
3. Continue as guest; no account is requested.
4. Enter required customer and delivery details.
5. Pay through Razorpay.
6. On payment result, create/update order state and show confirmation or actionable failure state.
7. Provide order reference and available status/help pathways.

9. Functional Requirements - Storefront

ID	Requirement	Description	Priority
FR-001	Premium entry experience	The site shall present a visually distinctive opening experience on initial entry.	P1
FR-002	Home page	The home page shall include brand introduction, featured products, offers, media and contact/CTA areas as configured.	P0

ID	Requirement	Description	Priority
FR-003	Responsive layout	The storefront shall adapt to mobile, tablet and desktop screen sizes.	P0
FR-004	Product browsing	Visitors shall browse products organized by category.	P0
FR-005	Product detail	Visitors shall see product name, images, description, features/specifications, price, discount, availability and configured action buttons.	P0
FR-006	Search	Visitors shall be able to search products.	P1
FR-007	WhatsApp	Relevant pages shall expose a WhatsApp contact route.	P1
FR-008	Gallery	The site shall support image/video gallery content.	P1
FR-009	Reviews	The product/site shall support customer review content where configured.	P2
FR-010	Legal pages	Privacy policy and terms pages shall be available when supplied/published.	P0

10. Functional Requirements - Product Catalog

The source questionnaire states that there are more than 100 products. The catalog therefore needs a proper database-backed product model rather than hard-coded product pages.

Field / capability	Requirement
Identity	Product name, unique identifier / SKU and category.
Media	Primary image plus additional images; video and brochure/PDF can be attached where available.
Description	Product description, features and specifications.
Pricing	Current price, discount information and display price.
Availability	Current stock quantity and availability state.
Variants	Support variants such as size/color where required by catalog.
Customer actions	Buy Now, Add to Cart, Enquiry / WhatsApp where configured.

Field / capability	Requirement
Merchandising	Featured flag, offer flag, low-stock threshold and promotional messaging configuration.
Reviews	Customer review display and moderation capability as a configurable feature.

11. Offers, Stock Messaging and Merchandising

11.1 50% OFFER

The latest client update explicitly requires the website to show a 50% offer. The PRD treats this as a configurable promotional message rather than hard-coding a discount into every product.

- Admin can mark an applicable product/campaign with an offer label such as “50% OFFER”.
- The final selling price and original price/discount presentation must be driven by the configured commercial values.
- Offer messaging can appear in the hero, promotional strip, product cards and product detail according to campaign configuration.

11.2 “3 stocks left” urgency messaging

The latest update requires a “3 stocks left” attention message. To keep the message operationally meaningful, the proposed implementation is inventory-backed: when available quantity is at or below the low-stock threshold and the admin has enabled the feature, the storefront can display the actual remaining quantity, for example “3 stocks left”.

Important behavior

Do not display a low-stock statement that contradicts the inventory record. The message should be generated from current stock or explicitly controlled by the admin.

11.3 Other merchandising controls

- Featured / best-selling product selection.
- Special offer banners.
- Discount labels.
- Limited-stock / low-stock thresholds.
- Homepage campaign ordering.

12. Cart, Guest Checkout and Razorpay

12.1 Cart requirements

- Add/remove products.
- Change quantity where stock permits.
- Show current price, discount and line total.
- Show subtotal and applicable charges defined by the business.

- Prevent checkout of unavailable quantity.
- Persist cart for the active shopping session.

12.2 Guest checkout requirements

- No account creation step.
- Collect only the information necessary for order fulfilment and communication.
- Validate contact and delivery fields before payment.
- Allow the buyer to review the final order before payment.

12.3 Razorpay

Razorpay is the required payment gateway. The exact payment instruments exposed to customers should follow the business Razorpay configuration and applicable merchant setup.

Payment state	Expected system behavior
Initiated	Create checkout/payment attempt reference and associate it with the cart/order draft.
Successful	Verify payment result, mark payment as successful, create/confirm the order, reserve/decrement stock according to the agreed inventory policy.
Failed	Keep order/payment in a recoverable failed or pending state and allow retry where appropriate.
Cancelled	Record cancellation and return the shopper to a clear recovery path.
Refund / reversal	Reflect the recorded refund/reversal state in admin and order history where applicable.

13. Order Lifecycle and Shopify-Like Operations

The client wants the system to work similarly to Shopify when an order is placed. This means an operationally complete order workflow, not a copy of Shopify's interface or proprietary behavior.

Stage	System behavior
Cart	Items and quantities are captured from the shopper session.
Checkout	Guest details and delivery details are validated.
Payment	Razorpay payment attempt is created and outcome is recorded.
Order created	Successful purchase produces a unique order reference and line items snapshot.
Inventory	Stock is updated according to the configured inventory policy.
Admin review	Order appears in the admin order queue with status and payment information.

Stage	System behavior
Fulfilment	Staff update order status as it moves through processing/shipping/delivery.
Completion	Order is marked completed/delivered when business workflow reaches the final state.

13.1 Recommended order statuses

Proposed statuses: Pending Payment -> Paid -> Processing -> Packed -> Shipped -> Delivered -> Cancelled / Payment Failed / Refunded. Final status labels can be adjusted to the business workflow.

14. WhatsApp and Customer Communication

- WhatsApp entry point in header/footer or persistent support control.
- Product-level WhatsApp action for enquiries where enabled.
- Cart/checkout support path for customers who need assistance.
- Admin-configurable WhatsApp number and prefilled message templates.
- Optional order reference insertion in support message after successful order.

The source forms also mention phone, email, contact form, Google Maps and social media. These can coexist with WhatsApp as secondary communication routes.

15. Admin Dashboard and Back Office

The earlier form requests a “Royal modern” admin dashboard. The PRD translates this into a polished, functional operational interface rather than a specific visual clone.

Module	Core capabilities
Dashboard	Order summary, sales/commerce indicators, low-stock products, active offers, recent orders.
Products	Create/edit/archive products, categories, media, descriptions, variants, pricing and visibility.
Inventory	View stock, change stock quantity, low-stock threshold, availability state.
Offers	Create/edit offer labels, discount values, campaign dates or active state as supported.
Orders	Search/filter orders, view order detail, payment state, customer/delivery information, status updates.
Content	Homepage sections, banners, featured products, gallery/media and social links.
Settings	Brand information, WhatsApp number, payment configuration references, store policies and operational settings.

Module	Core capabilities
Audit	Track important admin changes such as price, stock, offer and order status updates.

16. Real-Time Price, Inventory and Product Updates

The latest client update requires real-time price updating. The proposed implementation is a centralized backend data source for products so the storefront reads current values rather than relying on static page content.

Update	Expected storefront effect
Price updated by admin	New price is served to subsequent product/detail/cart requests without code deployment.
Discount updated	New discount label and effective price are shown according to campaign state.
Stock reduced after purchase	Availability is updated and low-stock messaging reflects the current quantity.
Product made unavailable	Product becomes unavailable for purchase and remains visible only if business configuration allows.
Featured status changed	Homepage/catalog placement updates according to content cache policy.

Implementation note

“Real-time” should be defined during engineering as immediate database/API freshness or a specified cache refresh window. The client requirement establishes the need for current pricing; the exact infrastructure latency target is TBD.

17. Content, Media and Social Integrations

The client states that content, product photos and descriptions will be provided. The system should therefore make content publication operationally manageable and avoid requiring development changes for routine edits.

- Home page copy and media.
- Product photography and descriptions.
- Gallery images/videos.
- Customer testimonials/reviews where supplied.
- Awards/certifications where applicable.
- Facebook and Instagram links.
- Google Maps and contact information.
- Legal pages supplied by the business.

18. Search, Navigation and Discovery

- Search products by name and relevant catalog terms.
- Browse by category.
- Support featured products and promotional collections.
- Provide clear navigation to Home, Products, About, Gallery, FAQ, Contact and legal pages.
- Keep important purchase actions visible on mobile.
- Provide useful empty-state and no-result messaging.

19. Analytics and Reporting

The source material does not specify an analytics platform. The product should nevertheless expose operational metrics needed to manage commerce. Platform choice is TBD.

Metric	Purpose
Orders	Track order volume and status breakdown.
Payment success / failure	Monitor checkout/payment health.
Top products	Identify products receiving the most purchases or attention where data is available.
Low stock	Prioritize replenishment.
Offer performance	Understand promotional campaign activity if analytics are enabled.
Cart / checkout drop-off	Identify friction in the purchase journey if analytics tooling is approved.

20. Non-Functional Requirements

Category	Requirement
Performance	Pages should load quickly enough for a premium shopping experience; exact page-speed targets to be finalized in implementation.
Responsive design	Support contemporary mobile, tablet and desktop viewports.
Accessibility	Keyboard navigation, readable contrast, meaningful labels and reduced-motion consideration for major animations.
SEO	Indexable product/category content, metadata, clean URLs and appropriate structured data where implemented.
Reliability	Payment/order processing must avoid duplicate order creation from retries/webhooks.

Category	Requirement
Scalability	Catalog architecture should comfortably support 100+ products and growth beyond the current count.
Maintainability	Routine product/price/stock/offer/order operations should be admin-driven, not code-driven.
Observability	Operational logs for payment/order failures and important admin actions.

21. Security, Privacy and Reliability

- HTTPS for all production traffic.
- Do not store raw payment card information; rely on the gateway's secure payment flow.
- Server-side validation for prices, stock and order totals; never trust client-calculated values for final order creation.
- Webhook verification for payment events.
- Admin authentication and session security even though customer accounts are not used.
- Role-based admin permissions if multiple staff users are later introduced.
- Rate limiting / abuse protection for sensitive endpoints.
- Secure handling of customer contact and delivery information.
- Backups and recovery process for product/order data.

22. Proposed Technical Architecture

The following is a proposed implementation architecture derived from the functional requirements; it is not stated verbatim in the client forms and should be reviewed by the implementation team.

Layer	Proposed responsibility
Presentation	Modern responsive web app with premium motion and reusable UI components.
Application/API	Business logic for catalog, cart, checkout, orders, offers, inventory, content and WhatsApp configuration.
Database	Products, categories, variants, prices, inventory, carts, orders, payments, offers, content and audit records.
Payment	Razorpay checkout + server-side verification/webhooks.
Media	Object/file storage or managed media service for product images and videos.
Admin	Authenticated back-office interface for operational updates.
Observability	Error logging, transaction logs and basic operational metrics.

22.1 High-level system flow

System flow

Customer browser -> Storefront -> API -> Product/Inventory data -> Cart -> Checkout -> Razorpay -> Payment verification
-> Order service -> Inventory update -> Admin order queue -> Fulfilment/status updates

23. Proposed Data Model

Entity	Key fields / relationships
Product	id, sku, name, slug, description, features, specifications, category_id, active, featured
ProductImage	id, product_id, url, alt_text, sort_order
Variant	id, product_id, option values, sku, price override, stock
Category	id, name, slug, description, sort_order, active
Inventory	product/variant reference, quantity, low_stock_threshold, availability
Offer	id, name, label, discount configuration, start/end or active state, applicable products/categories
Cart	id/session reference, items, totals, updated_at
Order	id, order_number, customer snapshot, delivery snapshot, totals, status, created_at
OrderItem	order_id, product snapshot, variant snapshot, quantity, price, discount
Payment	order_id, gateway reference, amount, status, timestamps, webhook references
ContentBlock	page, section, title/body/media, visibility, sort_order
AdminUser	id, name, email, role, active
AuditLog	actor, action, entity, before/after reference, timestamp

24. Proposed API Surface

These endpoints are an engineering starting point, not a final API contract.

Area	Example endpoints	Purpose
Products	GET /products, GET /products/{slug}	Browse catalog and product detail.

Area	Example endpoints	Purpose
Categories	GET /categories	Browse product categories.
Cart	POST /cart/items, PATCH /cart/items/{id}, DELETE /cart/items/{id}	Manage guest cart.
Checkout	POST /checkout/validate, POST /checkout/create	Validate and create an order/payment attempt.
Payments	POST /payments/razorpay/create, POST /webhooks/razorpay	Gateway integration and payment state updates.
Orders	GET /orders/{order_number}, PATCH /admin/orders/{id}	Customer-facing status lookup if enabled and admin status management.
Admin products	POST/PATCH /admin/products	Catalog administration.
Admin inventory	PATCH /admin/inventory/{id}	Stock updates.
Admin offers	POST/PATCH /admin/offers	Offer management.
Admin content	POST/PATCH /admin/content	Homepage and content management.

25. Testing and Acceptance Criteria

25.1 Critical acceptance scenarios

ID	Scenario	Action	Expected result
AC-01	Guest purchase	A new visitor can complete a purchase without login or registration.	Order created and payment recorded.
AC-02	Razorpay success	Successful Razorpay payment results in one confirmed paid order.	No duplicate order; payment state is correct.
AC-03	Payment failure	Failed payment does not produce a falsely paid order.	Customer sees clear recovery path.
AC-04	Price update	Admin changes a product price.	Subsequent storefront reads show the current value without redeploying code.
AC-05	Stock update	Admin lowers a product stock to 3.	Storefront can show “3 stocks left” when low-stock messaging is enabled.
AC-06	Offer	Admin configures a 50% offer for an applicable product/campaign.	Configured offer message and pricing are shown consistently.

ID	Scenario	Action	Expected result
AC-07	WhatsApp	Visitor taps WhatsApp action.	Correct business WhatsApp route opens with configured message.
AC-08	Order operations	Admin opens a newly placed order.	Order, payment, customer/delivery snapshot and status are visible.
AC-09	Inventory integrity	Two customers attempt to buy remaining stock.	System must prevent final stock from going negative or over-selling according to inventory policy.
AC-10	Responsive experience	Key journeys are executed on mobile and desktop.	No blocking layout issues and purchase actions remain usable.

25.2 QA checklist

- Functional testing of catalog/cart/checkout/order flows.
- Razorpay test-mode integration and webhook cases.
- Cross-browser testing for supported browsers.
- Responsive testing across representative mobile/tablet/desktop sizes.
- Accessibility review for key pages and motion.
- Security review of admin and checkout endpoints.
- Load/traffic testing appropriate for expected launch volume.
- Content proofing using final client-supplied product information.

26. Delivery Plan

Phase	Output
1. Discovery lock	Finalize client content, catalog structure, shipping/tax/order policy and unresolved TBDs.
2. UX / visual direction	Finalize sitemap, responsive wireframes, visual system and premium entry experience concept.
3. Storefront build	Home, catalog, product pages, search, gallery, content pages and responsive UI.
4. Commerce build	Cart, guest checkout, Razorpay, order creation and inventory behavior.
5. Admin build	Products, prices, inventory, offers, orders, content and audit operations.
6. Integrations	WhatsApp, social links, maps, analytics if approved.
7. QA / UAT	Acceptance scenarios, payment testing, responsive and content validation.

Phase	Output
8. Launch	Production configuration, domain/SSL, backups, monitoring and handover.

27. Risks, Dependencies and Assumptions

Item	Type	Impact / mitigation
Final product catalog is client-provided	Dependency	Build data import/content workflow so routine catalog updates are manageable.
Razorpay merchant configuration	Dependency	Requires verified business/payment account and production credentials before launch.
Shipping/delivery rules are not fully specified	Open	Finalize service areas, rates, carriers and tracking policy.
Taxes are not specified	Open	Confirm whether displayed prices are tax-inclusive and required tax calculations.
Stock messaging	Operational	Use actual inventory values or explicit admin configuration; avoid contradictory data.
Premium animation	UX risk	Keep animations performant and provide reduced-motion handling.
“Real-time” price updates	Technical definition	Define maximum acceptable freshness / cache delay during engineering.
More than 100 products	Scale	Use database-backed catalog and pagination/search rather than static pages.

28. Open Questions / TBD Items

These items were not fully defined by the supplied forms. They should be resolved before development is considered final.

1. What exact categories and subcategories will be used for the silver collection?
2. Are products sold only in India, and which delivery zones/states are supported?
3. How is shipping cost calculated: flat, free above a threshold, location-based, or carrier-based?
4. Are taxes included in displayed prices? If not, what tax rules must be applied?
5. Should customers receive order confirmation by email, WhatsApp, SMS, or more than one channel?
6. Should customers have a public order-status lookup using order number and a verification value?
7. What are the exact business order statuses and fulfilment responsibilities?
8. What return, refund, cancellation and exchange policies should appear on the site?

9. Should the 50% offer be sitewide, category-specific, product-specific or campaign-based?
10. Should low-stock messaging always display when stock ≤ 3 , or only when manually enabled?
11. What exact “real-time” price freshness target is required?
12. Who will administer the dashboard, and are multiple staff roles required?
13. Which analytics platform, if any, should be integrated?
14. Which final fonts, logo assets, imagery and exact brand guidelines will be supplied?
